HORIZON – NEXT GENERATION COMMODITY MANAGEMENT

In the commodity space two things are certain: markets will change and so will your business.
Successful businesses are agile businesses.

UPGRADING TO HORIZON IS THE MOST POWERFUL BUSINESS DECISION YOU'LL MAKE THIS YEAR.

7 KEY BENEFITS OF UPGRADING TO HORIZON

1. Realize true Technology Innovation:

Digitization is no longer just at the forefront of a company's technology goals, it's the smart business decision. With this in mind, Horizon is built for the cloud delivering business value that appreciates a significant reduction in capital expenditure, reduced maintenance needs and enables system access from any location.

2. Utilize Enhanced Software Features:

Allegro 8 has been translated and modernized to form independent product families within the Horizon platform making the system more user-friendly and overall more scalable. It's important to note that all future code enhancements will be available only in Horizon and that extension assessments and relevant modifications are all part of the upgrade process.

3. Streamline Business Processes:

An upgrade is an opportunity to conduct a gap analysis, consider what processes aren't working well and reflect on how your business has changed since your last upgrade. Upgrading can improve not only your day-to-day operations but also future proof longer term strategies too. Horizon helps your business scale.

4. Improved Performance:

Benefit from overall performance optimization across the entire platform, with a focus on valuation, settlement and reporting.

5. Increased Quality:

Key elements of the framework have been refactored to enable more test coverage and stats in future releases as well as ensure that automated testing is easier and can be integrated to the benefits of our customers.

6. Roadmap Advantage:

By upgrading to Horizon you will have access to the latest roadmap of functional enhancements and innovation, for each commodity stream and geographical market.

7. Reduced Time and Effort:

With the separation of products in Horizon, the componentised architecture simplifies product family upgrades, reducing time and effort on future upgrades. This product independence reduces regression testing requirements and overall upgrade efforts. Allegro's automated testing tool will soon be available as an additional option during the upgrade process.

Staying current on the latest Allegro platform means our customers can run their daily operations more smoothly and focus on their core business strategies, whether that be adding new trading desks, widening portfolio's or expanding into new geographies. Horizon, Allegro's latest release, is the future of CTRM.
