

# ALLEGRO HORIZON

**Allegro Horizon is the latest generation of software from Allegro to manage commodity transactions from deal to cash.**

This version of software moves to a product-centric environment to allow customers flexibility in how they implement and utilize new functionality. Horizon includes many fundamental changes to its underlying architecture that deliver enhanced performance and scalability. Allegro Horizon is also ready to be deployed in the cloud, which can provide even more long-term benefits.

*All of these features translate to a platform that has a lower total cost of ownership, is easier to support and will maximize return on investment by facilitating future growth.*

Horizon products sit on top of a Business Framework Layer and a Business Common Layer as illustrated above. The products can be upgraded individually without any disruption to the functions in the other layers. This means that Allegro customers can take new features and functions as needed without involving other business users or functions. This also reduces testing time and lowers the total cost of solution ownership.

Allegro also has the ability to introduce new products without forcing a full release upgrade. Horizon allows customers to license and implement software the way they do business – by function, department or desk.
