

ALLEGRO HORIZON

Horizon is the newest generation of the award-winning Allegro commodity management solution. While it looks, feels and functions much like Allegro 8, it offers tremendous structural, quality and performance enhancements.

THE NEXT PHASE OF COMMODITY MANAGEMENT

Horizon represents a technological leap forward in commodity management software, bringing an evolutionary product architecture that moves from tightly integrated components to a loosely coupled, yet tightly integrated, *portfolio of products*. The new architecture serves as the foundation for higher performance and a more scalable experience, while continuing to offer the industry-leading extensibility for which Allegro is known.

With Horizon, customers can buy and implement software the way they do business - by function, department or desk. Why is this important? Because it reduces the cost and risk of deployment and means significant flexibility as needs change in the future. Importantly, Horizon will shorten the Allegro innovation cycle, leading to more functionality, delivered more frequently, in a way that doesn't require extensive and time-consuming upgrades.

LEVERAGE FOR YOUR BUSINESS

Our new approach provides the flexibility today's commodity businesses demand. In particular, we're making significant use of the cloud, which will reduce the software evaluation and implementation period and bring more distributed work teams to bear on a single project, shortening the time to success. However, Allegro will keep providing the option of on-site deployment for Horizon, should that be the ideal decision for the enterprise.

Customers can expect a multitude of benefits from Horizon, including:

Based on data from Horizon's early adopters, performance improved as much as 25%-75%, depending on the use case.

- Faster project rollout and completion
- Quicker upgrade installs, with reduced risk and cost
- Increased performance in key processes such as valuation, settlement and reporting
- More rapid decision-making, which maximizes profit potential
- The CTRM industry's best platform for flexibility, extensibility and ease-of-use
- New telemetry - Allegro is now largely self-diagnosing, reducing operational risk and downtime

HORIZON PREPARES YOU FOR TOMORROW

With Horizon, there are no more monolithic applications with two-year implementations and even longer innovation cycles. This latest iteration of our software delivers powerful results, and it delivers them fast, without compromising the technological superiority that's been a hallmark of Allegro since its founding in 1984. Best of all, Horizon is forward-compatible and built for your business, allowing for the deployment of software in a way that's directly aligned to your organization's requirements. Horizon, in short, is a new pathway, one that will allow Allegro to innovate faster, with significantly less risk and with improved quality.

At Allegro, our software is more capable than ever. Our focus on customers has never been sharper. The experience we've amassed over three decades in the commodity industry has led us to this moment. This is Allegro Horizon.
